동국대 서베이앤헬스폴리시리서치센터의  
역사와 사명

## Survey Research Center + Health Policy Research Center (Since 2004)

The screenshot shows a web browser window displaying the SHPRC website. The address bar shows <http://shprc.dongguk.edu/>. The page has a dark blue header with navigation links: About SHPRC, Center Services, Center Activity, Boards, and Links. The Dongguk University logo is in the top right, along with a 'SHPRC home' button and a '동국대학교 홈페이지 바로가기' link.

The main content area features a large banner image of a university building with the text '동국대학교 서베이앤헬스폴리시리서치센터' and 'Survey & Health Policy Research Center' overlaid. Below the banner, there is a '공지사항' (Notice) section with a 'More' link and a '센터소식' (Center News) section with a 'More' link. A login form is visible on the left side of the banner area, containing fields for '이메일' (Email) and '비밀번호' (Password), and buttons for '회원가입' (Sign Up) and '로그인' (Login).

At the bottom of the page, there is a footer with the Dongguk University logo, a privacy policy notice: '홍 | 개인정보 보호방침 | 이메일 무단 수집 거부', and contact information: '서울시 중구 필동 2가 동국대학교 총무부관 신관 109호 동국대학교 내용의 무단 복제, 복사, 전제, 연중, 출판, 전사, 판매를 금합니다. 전화 02-2263-2229 E-mail dgist@dongguk.edu COPYRIGHTS DONGGUK UNIVERSITY SINCE 1906. ALL RIGHTS RESERVED.' The browser status bar at the bottom indicates '신뢰할 수 있는 사이트' (Trusted site) and '100%' zoom.

## 센터 소개

### □ 센터장 인사말

안녕하십니까? 동국대학교 서베이앤헬스폴리시리서치센터에 오신 것을 환영합니다.

저희 센터는 "사회공헌"을 목적으로 설립되어 '서베이(통계조사)'를 기반으로 보건/복지/문화/의료/식품 등의 정책 개발 및 연구를 수행하는 순수 대학 기관입니다.

현재 국내에서는 각종 실태 파악 및 정책 활용 등을 목적으로 수많은 통계들이 정부 또는 민간 기관들에 의해 실시되는 서베이를 통해 얻어지고 있습니다. 그렇지만 이들 서베이의 방법론 및 통계들의 품질은 선진국들에 비해 매우 미약한 수준입니다. 이는 빠르게 변화하는 국내의 환경에 맞춘 지속적이고 과학적인 조사방법론(survey methodology)의 연구를 통해서만 극복이 될 수 있습니다. 더욱이 현재와 같이 국내에서 낮은 품질의 통계들이 계속해서 만들어지고 사용된다면 정확하고 가치 있는 통계는 점점 더 뿌리내리기 어려워져 통계에도 "악화는 양화를 구축한다"는 '그레섬의 법칙'이 지배할 수 있습니다.

이에 서베이앤헬스폴리시리서치센터는 최신의 실용적인 조사방법론을 개발하고 이를 연구 환경이 열악한 국내 조사기관들 뿐만 아니라 해외의 기관들에게도 보급할 것입니다. 또한 이러한 노하우를 기반으로 보다 신뢰성이 높은 정확한 조사통계를 작성하여 학문적인 영역은 물론이고 국가와 사회 등의 주요 실태와 문제점들에 대한 정책 및 해결책 마련에 기여하고자 최선의 노력을 다할 것입니다.

감사합니다.

동국대학교 서베이앤헬스폴리시리서치센터 센터장

김선웅

2부

**Survey Sampling and Survey Research**

# 1. Basic Concepts

# Sampling

The process of selecting a subset of population

## Survey Sampling

The process of selecting a **random sample** of elements from a *frame* to conduct a *survey* for a *target population*

## What do mean “random”?

It means that all human influence is removed from the selection process. To achieve a random selection, random numbers are used.

The samples corresponding to those random numbers selected are called “probability samples.”

## Probability or Non-probability Sample?

### 1) “Survey 2000” by the US National Geographic Society (NGS)

- Web-based survey
- 80,000 visitors to the web page and over 50,000 completions of the questionnaire
- Seeing live theater: 60%
- Visiting an art museum or gallery: 77%

### 2) “Survey of Public Participation in the Arts” by the US National Endowment for the Arts

- Telephone survey
- Using randomly generated telephone numbers
- Musical theater: 25%
- Nonmusical theater: 16%
- Visiting an art museum or gallery: 35%

## Is Sampling Important in Survey?

If the sample is selected **haphazardly or with subjective decision**, there may be **little hope** of making **correct estimation** to the population, although other survey processes including field supervision and management are successfully completed.

The haphazard or convenience selection methods have a disadvantage – there is no theoretical support. **Many surveys still use haphazardly or purposively selected samples.**

## Is Sampling Important in Survey? (Cont.)

(Example) Quota Sampling

<b>Control Characteristic</b>	<b><u>Population composition</u></b>	<b><u>Sample composition</u></b>	
	Percentage	Percentage	Number
Sex			
Male	48	48	480
Female	52	52	520
	<u>100</u>	<u>100</u>	<u>1000</u>

## Is Sampling Important in Survey? (Cont.)

U.S. Presidential Election 1948

## Correct Estimation?

- 1) Accuracy: sampling bias
- 2) Precision: sampling variance

They arise through sampling and can be controlled by sampling.

## Samples and Estimates

If one use a **single probability sample**, inferences about the population with known levels of confidence can be made

A confidence interval is commonly denoted by

$$\bar{y} \pm z_{\alpha/2} se(\bar{y})$$

$$p \pm z_{\alpha/2} se(p)$$

## Survey Statistics and Survey Statisticians

Survey Statistics (조사통계학)

Survey Statisticians (조사통계학자) or Survey Methodologists (조사방법론학자)

Sample Designs (표본설계) or Sampling

Samplers (표본설계전문가)

AAPOR and the American Statistical Association

Statistics Canada

## Jerzy Neyman?

- Randomized Experiments in 1923
- Confidence Interval in 1937
- Neyman-Pearson Lemma for hypothesis testing
- The groundbreaking event leading to modern scientific sampling

Neyman, J. (1934), “ On the Two Different Aspects of the Representative Method: The Method of **Stratified Sampling** and the Method of Purposive Selection,” *Journal of the Royal Statistical Society*, 97, pp. 558-625.

## Components of Sample Design

- 1) *Sample size*
- 2) *Selection probabilities* of elements or samples
- 3) *Stratification* to control the representation of key subpopulations in the sample
- 4) Selection of groups called *clusters*

## 2. Popular Sampling Theory

## Simple Random Sampling

This sample design assign an *equal probability of selection* to each frame element ( $n=1$ ), to all pairs of frame elements ( $n=2$ ), to all triplets of frame elements ( $n=3$ ), etc.

(Procedure)

- 1) Number all elements within a frame from 1 to N.
- 2) Select random numbers from 1 to N **without replacement**.
- 3) Identify the elements corresponding to the selected random numbers.

$$p(s) = \frac{n}{N} \frac{n-1}{N-1} \frac{n-2}{N-2} \cdots \frac{1}{N-n+1} = \frac{n!(N-n)!}{N!} = \frac{1}{{}_N C_n}$$

## Simple Random Sampling (Cont.)

SRS is a special case of an “epsem” for equal probability of selection method.

$$\bar{y} = \frac{1}{n} \sum_{i=1}^n y_i$$

$$v(\bar{y}) = (1-f) \frac{s^2}{n}, \quad f = \frac{n}{N}$$

$$s^2 = \frac{1}{n-1} \sum_{i=1}^n (y_i - \bar{y})^2$$

## Simple Random Sampling (Cont.)

(Theorem)

The sample mean  $\bar{y}$  from a simple random sample is an unbiased estimator of  $\mu$

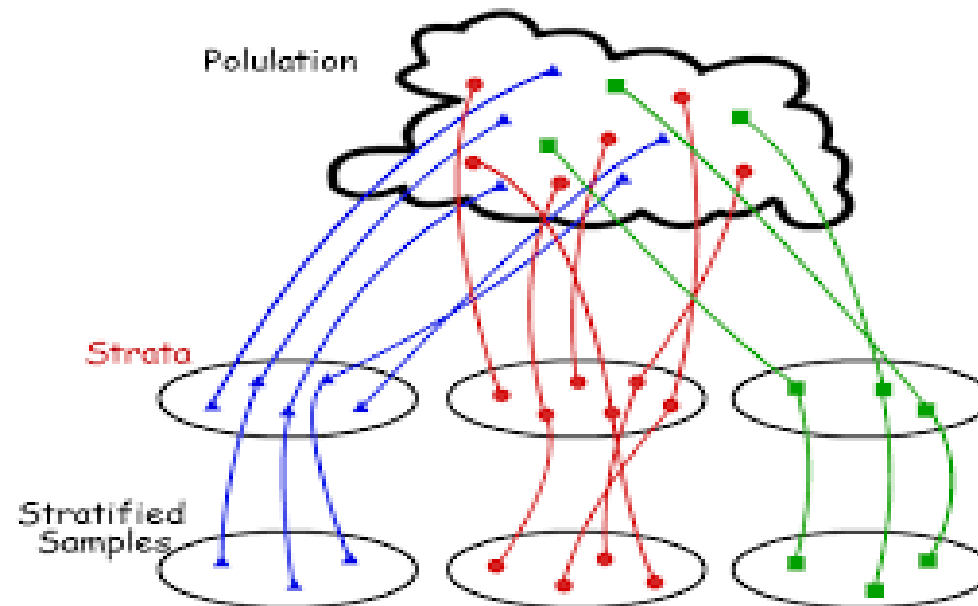

$$\begin{aligned} \text{(pf)} \quad E(\bar{y}) &= \sum_s \bar{y} p(s) \\ &= \sum \bar{y} \frac{1}{N C_n} \\ &= \frac{n!(N-n)!}{N!} \frac{1}{n} \sum (y_1 + y_2 + \cdots + y_n) \\ &= \frac{(n-1)!(N-n)!}{N!} \sum (y_1 + y_2 + \cdots + y_n) \\ &= \frac{(n-1)!(N-n)!}{N!} {}_{N-1}C_{n-1} (y_1 + y_2 + \cdots + y_N) \\ &= \frac{(n-1)!(N-n)!}{N!} \frac{(N-1)!}{(n-1)!(N-n)!} (y_1 + y_2 + \cdots + y_N) \\ &= \frac{1}{N} (y_1 + y_2 + \cdots + y_N) \end{aligned}$$

## Stratified Random Sampling

Each element in a population (a frame) can be placed in a single “stratum (group).”

Separate samples are drawn from each stratum, using the same sampling method or using different sampling methods.

Separate estimates are obtained from each stratum, and they are combined to estimate population values.

## Stratified Random Sampling (Cont.)

Sampling fraction in epsem:  $f = \frac{n}{N}$

**Proportionate allocation** to select the sample in each stratum  $h$  with SRS:

$$f_h = \frac{n_h}{N_h} = f \Rightarrow n_h = n \frac{N_h}{N} = nW_h \Rightarrow n_h \propto N_h$$

(Example) From  $N = 8,000$  schools divided into three strata, a stratified sample of  $n = 480$  is selected. The survey asks principals of the schools how many vocational classes are offered this year.

## Stratified Random Sampling (Cont.)

$$n_h = 480 \frac{N_h}{8,000} = 0.06N_h$$

Unweighted mean:  $(6 + 5 + 8)/3 = 6.3$

$$\begin{aligned} \text{Weighted mean: } \bar{y}_{st} &= \sum_{h=1}^H W_h \bar{y}_h \\ &= (0.4 \times 6) + (0.5 \times 5) + (0.1 \times 8) \\ &= 5.7 \end{aligned}$$

$$\text{Sampling variance: } v(\bar{y}_{st}) = \sum_{h=1}^H W_h^2 (1 - f_h) \frac{s_h^2}{n_h}$$

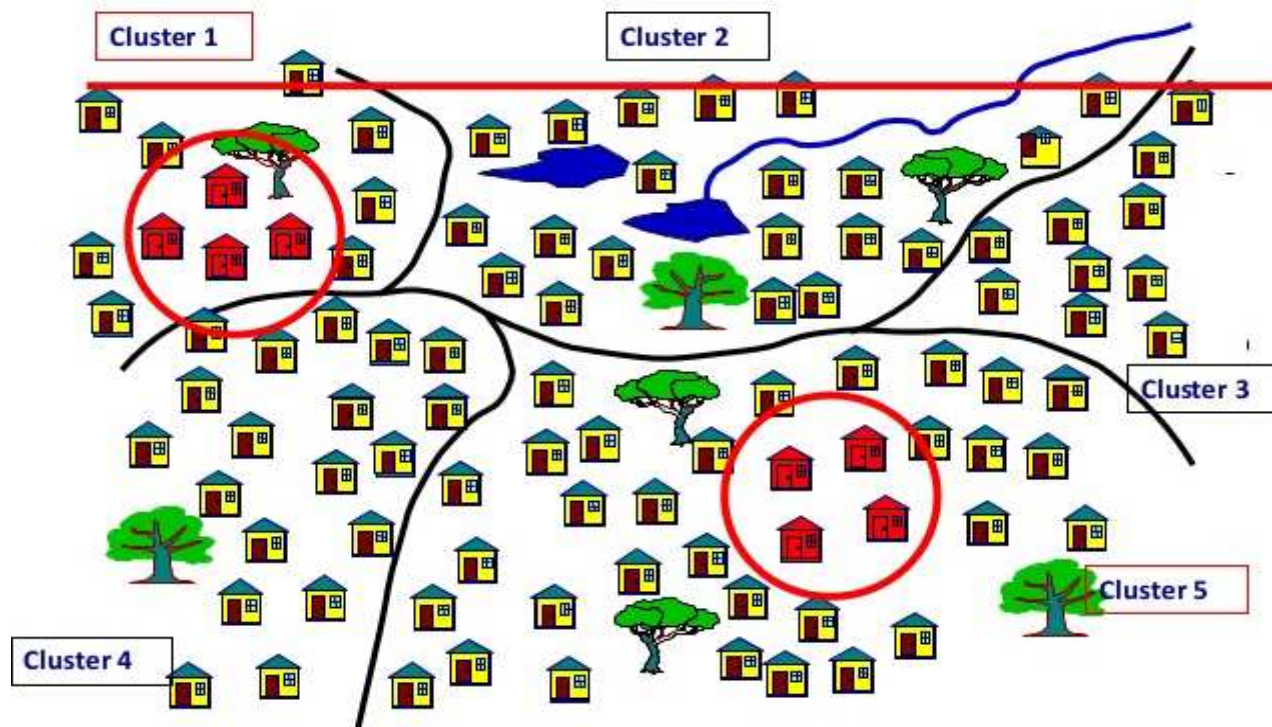

$$s_h^2 = \frac{1}{n_h - 1} \sum_{i=1}^{n_h} (y_{hi} - \bar{y}_h)^2$$

$$se(\bar{y}_{st}) = \sqrt{v(\bar{y}_{st})} = \sqrt{0.00920} = 0.096$$

95% Confidence interval estimate:  $5.7 \pm 1.96 \cdot 0.096$  or (5.5, 5.9)

## Cluster Sampling

We may sample clusters of elements and then do interview the elements only within the selected clusters.

## Cluster Sampling

$$\bar{y} = \frac{1}{aB} \sum_{\alpha=1}^a \sum_{\beta=1}^B y_{\alpha\beta}$$

$$v(\bar{y}) = (1-f) \frac{s_a^2}{a}$$

$$s_a^2 = \frac{1}{a-1} \sum_{\alpha=1}^a (\bar{y}_{\alpha} - \bar{y})^2$$

### 3. Development of Telephone Survey Methodology and Applications

---

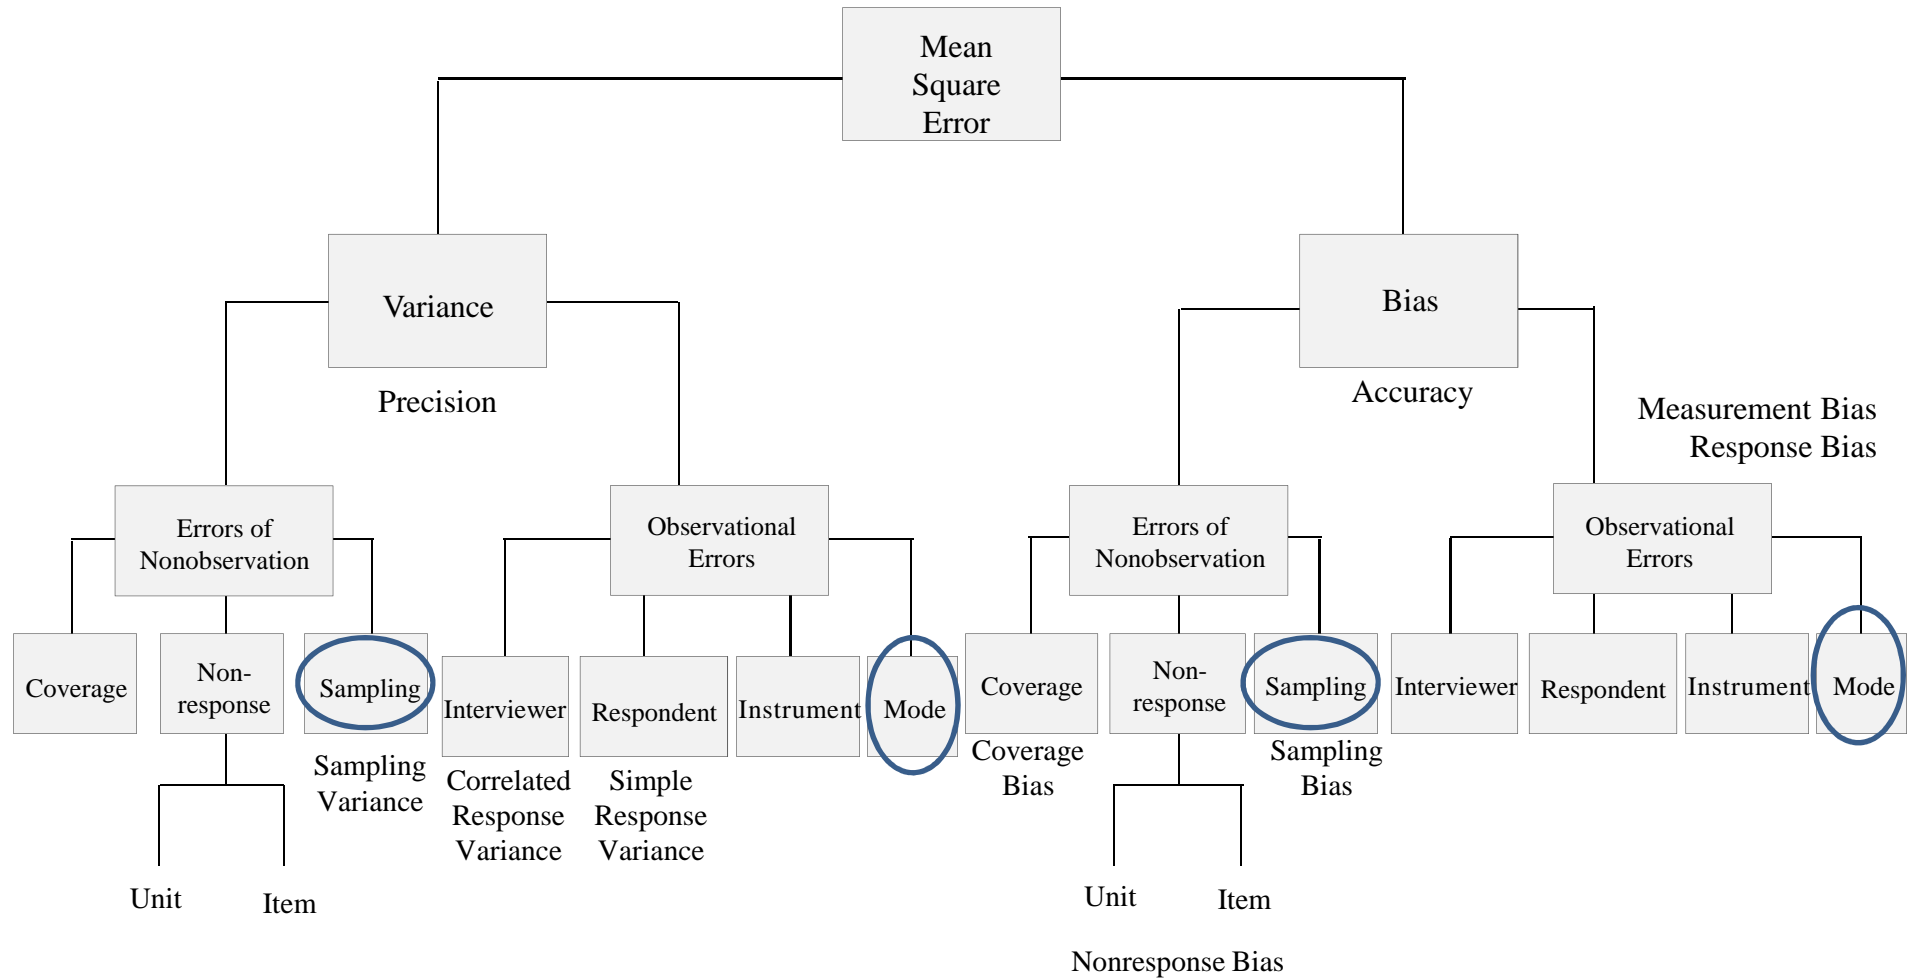

Groves *et al.* (2009)

“*Survey methodology* seeks to identify principles about the *design, collection, processing, and analysis* of surveys that are linked to the cost and quality of survey estimates.”

Information in a survey is gathered primarily by asking people questions.

# Sources of Errors in Surveys

❖ The structure and language of errors in total survey error (Groves, 2004)

## Changing Mode

### Face-to-Face (FTF) Surveys and Area Frames

## Changing Mode (Cont.)

By the late 1960s, the cost of face-to-face (FTF) surveys was escalating while, at the same time, [the proportion of households with telephones](#) had grown to close to [90 percent](#), both in North America and Europe.

Furthermore, the decline in response rates in FTF surveys made [the possibility of using the telephone as a mode](#).
