# List-Assisted RDD Sampling in Korea :Testing the Feasibility of National Surveys 

SunWoong Kim, SangKyung Lee

SungJoon Hong, SoHyung Park
Dongguk University \& Hyundae Research Institute

2009 World Association for Public Opinion Research
September 11-13, Lausanne, Switzerland

## Outline

- Previous Studies on Telephone Samples in Korea and U.S.
- Alternatives in Korea
- KOIS Database
- Incidence of Listed Phones in Residential Banks in Korea and U.S.
- Implementing GENESYS-type List Assisted RDD Sampling
- Computer-assisted Telephone Interviewing
- List Assisted RDD Frame Size
- Data Collection Process
- Survey Results
- Survey Cost
- Discussion

## Previous Studies on Telephone Samples in Korea

- Kim (2004)
"The Changes in Fixed Telephone Household Coverage Rates"
- Showed the changes in coverage rates in both fixed telephones and mobile phones
- The level of fixed telephone household noncoverage is much higher than $30 \%$ due to about $10 \%$ mobile only households.

## Previous Studies on Telephone Samples in Korea

- Kim, Hong, and Park (2007)
"Household Noncoverage in Fixed Line Phone Surveys in Korea"
- The telephone directory frames may nationally cover under $65 \%$ of households.
- Due to nonresidential or nonworking numbers, the national or local undercoverage will be much higher than the levels presented.
- Directory or directory-based samples may produce considerably biased estimates because of the noncoverage problem.

## Previous Studies on Telephone Samples in Korea

 (cont.)- Kang et al. (2008)
"Random Digit Dialing Telephone Survey and Major Findings"
- Used Early RDD sampling method after eliminating business numbers
- Attached four-digit numbers between 0000 and 9999 to area codeprefix combinations
- Used quota sampling rules to choose a respondent in a household

## Telephone Samples in the USA

- Household Level
- Cooper (1964)

Early RDD sampling: adding four-digit suffixes to known prefixes

- 75 to 80 percent are not assigned to a household

## Telephone Samples in the USA (cont.)

- Landon and Banks (1977)

Plus digit sampling (e.g. plus one sampling):
A list-assisted procedure in which a sample is selected from a directory and an integer is added to the last digit of the selected numbers

- It assumes that unlisted numbers are evenly mixed among listed numbers.

## Telephone Samples in the USA

- Mitofsky(1970), Waksberg(1978)

Two stage RDD sampling (Mitofsky-Waksberg(M-W) technique):
Step1) One obtains each 100 bank by first drawing a valid combination of area code and prefix and then drawing the first two digits of the suffix.

Step2) 1 of the 100 numbers in each 100 bank is selected by drawing two digits for the last half of the suffix. The selected phone number in each 100 bank is dialed. If it is a residential number, the 100 bank is retained. If not, the 100 bank is discarded.

## Telephone Samples in the USA (cont.)

Step3) Additional phone numbers are drawn and dialed from each retained 100 bank until residential numbers are obtained in each 100 bank.

- The method is cumbersome to administer since it sometimes takes a fairly large number of callbacks to determine whether or not a telephone number is residential.

## Telephone Samples in the USA

 (cont.)- Potthoff (1987)

Generalization of the M-W technique
: Choosing phone numbers per PSU in determining whether to retain the cluster

- Groves and Lepkowski (1986)

Dual-frame sampling
: Selecting a portion of a telephone sample from the frame of listed telephone numbers and the remainder from an RDD frame

## Telephone Samples in the USA

(cont.)

- Casady and Lepkowski (1993)

Two-stratum list-assisted RDD design
: high-density stratum including 100 banks with one or more listed phone numbers and low-density stratum including all remaining phone numbers

- Superior to both original RDD and M-W technique

## Telephone Samples in the USA (cont.)

- Brick, Waksberg and Kulp (1995)

Described the coverage bias for a particular method of listassisted RDD sampling developed by GENESYS, a commercial sampling vendor

Presented that only about 3 to 4 percent of all residential households are excluded

Became the standard for most list-assisted RDD samples
Handled by several commercial sampling vendors possessing the capacity to continuously update national list frames

## Telephone Samples in the USA

- Person Level

How to select one eligible person (adult) in the household?
Simple quota sampling? Or random sampling?
Random sampling in most surveys is implemented by computer program-assisted method, which makes random selection by computer at the time of listing eligible persons in the household

## Alternatives in Korea

a. Early RDD sampling
b. Plus digit sampling
c. $\mathrm{M}-\mathrm{W}$ technique
d. Modified $\mathrm{M}-\mathrm{W}$ technique
e. Lepkowski-Groves technique
f. Modified Lepkowski-Groves technique
g. Casady-Lepkowski technique
h. Modified Casady-Lepkowski technique
i. GENESYS Sampling Systems
j. GENESYS-type List-Assisted RDD Sampling
k. New Techniques

## Korea Info Service (KOIS) Database, 2008

|  | Residential | Business |
| :---: | :---: | :---: |
| Listed Numbers | $8,636,741(53.6 \%)$ | $4,438,243(51.5 \%)$ |
| Unlisted <br> Numbers | $7,483,316(46.4 \%)$ | $4,172,069(48.5 \%)$ |
| Total | $16,120,057$ | $8,610,312$ |

## Incidence of listed phones in working 100-banks (USA)

Source : Lepkowski et al. (2008) "Advances in Telephone Survey Methodology"

## Incidence of listed phones in working 100-banks (Korea, 2008)

Source : KOIS (2008)
(USA, 2008)

The rate of incidence of listed phones in working banks in Korea and USA (2008)

$$
\text { - - - U.S.A }- \text { Korea }
$$

## Implementing List-Assisted RDD Sampling in Korea

1. All residential exchanges and working 100-banks are determined by using the KOIS telephone directories.
2. Establish a list-assisted RDD frame consisting of all listed numbers that are in 100-banks with one or more listed phone number.
3. Business numbers are eliminated from the RDD frame.
4. All exchanges and working 100 -banks in the same area code are arrayed in ascending order.
5. A systematic sample with fractional intervals is selected from the phone numbers in the RDD frame.
6. Epsem (Equal Probability Selection Method) sample is generated in this design.

## The National Sustainability Study (NSS)

The NSS, which was conducted by the Survey Research Laboratory (SSL) in Donnguk University and Hyundae Research Institute, was designed to test the feasibility of listassisted RDD.
(Sample Design)

1) The country was stratified into 7 metropolises and 9 provinces.
2) The households in each stratum were selected by using list-assisted RDD sampling. A respondent within the selected household was randomly selected.
3) The sample size of 504 was decided to estimate a proportion with a bound on the error of estimation of magnitude 3.7 percent point.
4) Neyman allocation was used to decide the sample size of each stratum.
5) Epsem sample is selected in each stratum.

## Computer-assisted Telephone Interviewing

1) The CATI system developed by Hyundae Research Institute was used.
2) The system involves a variety of tools for quality controls.
3) The system was redesigned for a new quality control.
4) The interviews by skillful interviewers were conducted for one week at the end of October, 2008.

## List-Assisted RDD Frame Size

| No. of RDD <br> 100 -banks | Initial RDD <br> Frame Size | Screened <br> commercial <br> numbers | Final RDD <br> Frame Size |
| :---: | :---: | :---: | :---: |
| 378,947 | $37,894,700$ | $4,038,285$ | $33,856,415$ |

## Distribution of Dialed Numbers by Category

| Category | Frequency | $\%$ | Cumulative <br> $\%$ |
| :---: | :---: | :---: | :---: |
| Non-working (missing) | 5,810 | 48.7 | 48.7 |
| Unconnected (no ringing, <br> silence) | 83 | 0.7 | 49.4 |
| Fax | 272 | 2.3 | 51.7 |
| Undetermined if residential | 8 | 0.1 | 51.8 |
| Business | 788 | 6.6 | 58.4 |
| Residential | 4,967 | 41.6 | 100.0 |
| Total | 11,928 | 100.0 |  |

Note. 'Residential' numbers may not be households.

## Distribution of Dialed Numbers by "Listed"

| Category | Listed | Frequency |  | $\%$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Y | 907 | 5,810 | 7.6 | 48.7 |
|  | N | 4,903 |  | 41.1 |  |
| Other | Y | 16 | 83 | 0.1 | 0.7 |
|  | N | 67 |  | 0.6 |  |
| Fax | Y | 70 | 272 | 0.6 | 2.3 |
|  | N | 202 |  | 1.7 |  |
| Undetermined if residential | Y | 2 | 8 | 0.0 | 0.1 |
|  | N | 6 |  | 0.1 |  |
| Business | Y | 187 | 788 | 1.6 | 6.6 |
|  | N | 601 |  | 5.0 |  |
| Residential | Y | 1,677 | 4,967 | 14.1 | 41.6 |
|  | N | 3,290 |  | 27.6 |  |
| Total | Y | 2,859 | 11,928 | 24.0 | 100.0 |
|  | N | 9,069 |  | 76.0 |  |

## Distribution of Residential Numbers by Category

| Category | Frequency | \% |
| :---: | :---: | :---: |
| No answer* | 1,571 | 31.6 |
| Busy | 140 | 2.8 |
| Completed Interviews | 504 | 10.1 |
| Undetermined if it is a household ** | 1,826 | 36.8 |
| Refusal Household | 329 | 6.6 |
| - Receiver Both household and business | 4 | 0.1 |
| Subtotal | 2,159 | 43.5 |
| Refusal - Respondent | 164 | 3.3 |
| No contact - Respondent | 398 | 8.0 |
| Ineligible - no adults | 2 | 0.0 |
| Broken Appointments | 17 | 0.3 |
| Determined if it is a household | 12 | 0.2 |
| Total | 4,967 | 100.0 |

Note. ${ }^{*}$, **: Strong possibilities of being households

| Category |  | Listed | Frequency |  | \% |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| No answer |  | Y | 456 | 1,571 | 9.2 | 31.6 |
|  |  | N | 1,115 |  | 22.4 |  |
| Busy |  | Y | 28 | 140 | 0.6 | 2.8 |
|  |  | N | 112 |  | 2.3 |  |
| Completed Interviews |  | Y | 185 | 504 | 3.7 | 10.1 |
|  |  | N | 319 |  | 6.4 |  |
| Refusal - receiver | Undetermined if it is a household | Y | 662 | 1,826 | 13.3 | 36.8 |
|  |  | N | 1,164 |  | 23.4 |  |
|  | household | Y | 118 | 329 | 2.4 | 6.6 |
|  |  | N | 211 |  | 4.2 |  |
|  | Both household and business | Y | 4 | 4 | 0.1 | 0.1 |
|  |  | N | 0 |  | 0.0 |  |
|  | Subtotal | Y | 784 | 2,159 | 15.8 | 43.5 |
|  |  | N | 1,375 |  | 27.7 |  |
| Refusal - respondent |  | Y | 66 | 164 | 1.3 | 3.3 |
|  |  | N | 98 |  | 2.0 |  |
| No contact - Respondent |  | Y | 148 | 398 | 3.0 | 8.0 |
|  |  | N | 250 |  | 5.0 |  |
| Ineligible - no adults |  | Y | 0 | 2 | 0.0 | 0.0 |
|  |  | N | 2 |  | 0.0 |  |
| Broken Appointments |  | Y | 6 | 17 | 0.1 | 0.3 |
|  |  | N | 11 |  | 0.2 |  |
| Determined if it is a household |  | Y | 4 | 12 | 0.1 | 0.2 |
|  |  | N | 8 |  | 0.2 |  |
| Total |  | Y | 1,677 | 4,967 | 33.8 | 100.0 |
|  |  | N | 3,290 |  | 66.2 |  |

## Household Hit-Rate

|  |  | Hit-Rate |  |
| :---: | :---: | :---: | :---: |
| Category | Frequenc <br> y | Including non-working, fax, <br> and businesses (11,928) | Excluding non-working, fax, <br> and businesses (4,967) |
| Household | 1,417 | 11.9 | 28.5 |
| Household <br> and Business | 13 | 0.1 | 0.3 |
| Total | 1,430 | 12.0 | 28.8 |

Note. 'Total' = 'Completed Interview's + 'Refusal-receiver (household, both household and businesses)' + 'Refusal-respondent' + 'No contact-respondent' + 'Ineligible-no adults' + 'Broken Appointments'

+ 'Determined if it is a household'
Note. Comparatively low hit rate due to 'No answer' and 'refusal-receiver'

## Comparison of Distribution of Household Sizes

| Persons | List Assisted RDD |  | 2005 Census |
| :---: | :---: | :---: | :---: |
|  | Frequency | \% | \% |
| 1 | 107 | 8.7 | 19.9 |
| 2 | 252 | 20.4 | 22.2 |
| 3 | 265 | 21.4 | 20.9 |
| 4 | 423 | 34.2 | 27.0 |
| 5 | 141 | 11.4 | 7.7 |
| 6 | 37 | 3.0 | 2.3 |
| 7 | 7 | 0.6 |  |
| 8 | 3 | 0.2 |  |
| 10 | 1 | 0.1 |  |
| Total | 1,236 | 100.0 | 100.0 |

## Comparison of Sex and Age Distribution

|  | Male |  | Female |  | Total |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Frequency | $\%$ | Frequenc <br> y | $\%$ | Frequency | $\%$ |
| List Assisted RDD | 186 | 36.9 | 318 | 63.1 | 504 | 100.0 |
| 2005 Census | $17,148,18$ <br> 4 | 49.0 | $17,816,85$ <br> 5 | 51.0 | $34,965,039$ | 100.0 |

|  | Age |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $20-29$ | $30-39$ | $40-49$ | $50-59$ | $60-69$ | $70-79$ | 80 and over |  |
| List Assisted RDD | 9.9 | 21.8 | 28.6 | 15.9 | 11.9 | 8.3 | 3.6 |  |
| 2005 Census | 21.0 | 23.5 | 22.9 | 14.7 | 10.2 | 5.8 | 1.9 |  |

## Number of callbacks for listing eligible persons

| Number | Frequency | $\%$ | Cumulative \% |
| :---: | :---: | :---: | :---: |
| 0 | 496 | 41.9 | 41.9 |
| 1 | 256 | 21.6 | 63.5 |
| 2 | 176 | 14.9 | 78.3 |
| 3 | 109 | 9.2 | 87.5 |
| 4 | 69 | 5.8 | 93.3 |
| 5 | 39 | 3.3 | 96.6 |
| 6 | 23 | 1.9 | 98.6 |
| 7 | 9 | 0.8 | 99.3 |
| 8 | 4 | 0.3 | 99.7 |
| 9 | 3 | 0.3 | 99.9 |
| 14 | 1 | 0.1 | 100.0 |
| Total | 1,185 | 100.0 |  |

## Number of callbacks for contact with sampled person

| Number | Frequency | $\%$ | Cumulative \% |
| :---: | :---: | :---: | :---: |
| 0 | 273 | 40.8 | 40.8 |
| 1 | 152 | 22.7 | 63.5 |
| 2 | 87 | 13.0 | 76.5 |
| 3 | 65 | 9.7 | 86.2 |
| 4 | 41 | 6.1 | 92.4 |
| 5 | 24 | 3.6 | 96.0 |
| 6 | 14 | 2.1 | 98.1 |
| 7 | 8 | 1.2 | 99.3 |
| 8 | 1 | 0.1 | 99.4 |
| 9 | 3 | 0.4 | 99.9 |
| 14 | 1 | 0.1 | 100.0 |
| Total | 669 | 100.0 |  |

## Number of callbacks from lisiing to contact of respondent

| Number | Frequency | $\%$ | Cumulative \% |
| :---: | :---: | :---: | :---: |
| 0 | 638 | 95.4 | 95.4 |
| 1 | 12 | 1.8 | 97.2 |
| 2 | 5 | 0.7 | 97.9 |
| 3 | 3 | 0.4 | 98.4 |
| 4 | 2 | 0.3 | 98.7 |
| 5 | 2 | 0.6 | 99.3 |
| 6 | 2 | 0.3 | 99.6 |
| 7 | 1 | 0.1 | 99.9 |
| 8 | 669 | 100.0 | 100.0 |
| Total |  |  |  |

## Complete Rate (listing to completing interview)

|  | listing | contact | complete |
| :---: | :---: | :---: | :---: |
| Frequency | 1,185 | 669 | 504 |
| $\%$ | 100 | 56.4 | 42.5 |

## Comparison between listed and unlisted numbers

## : Sex

| Sex | Listed Numbers | Unlisted Numbers | $95 \%$ Interval Estimate <br> of True Difference |  |
| :---: | :---: | :---: | :---: | :---: |
| Male | $39.8 \%$ | $36.9 \%$ | $-2.9 \%$ | $8.8 \%$ |
| Female | 60.2 | 63.1 | -8.8 | 2.9 |

## Comparison between listed and unlisted numbers

: Age

| Age | Listed Numbers | Unlisted Numbers | $95 \%$ Interval Estimate <br> of True Difference |  |
| :---: | :---: | :---: | :---: | :---: |
| $20-29$ | $11.7 \%$ | $12.0 \%$ | $-4.2 \%$ | $3.6 \%$ |
| $30-39$ | 17.9 | 21.4 | -8.3 | 1.2 |
| $40-49$ | 27.5 | 28.1 | -6.1 | 4.8 |
| $50-59$ | 15.1 | 18.6 | -7.9 | 1.0 |
| 60 and over | 27.8 | 19.9 | 2.7 | 13.1 |

# Comparison between listed and unlisted numbers <br> : Education 

| Education | Listed <br> Numbers | Unlisted <br> Numbers | 95\% Interval Estimate <br> of True Difference |  |
| :--- | :---: | :---: | :---: | :---: |
| None | 5.0 | 2.9 | -0.4 | 4.5 |
| Elementary school graduate | 14.3 | 8.7 | 1.8 | 9.5 |
| Middle school graduate | 12.1 | 8.5 | -0.1 | 7.3 |
| High school graduate | 32.6 | 32.9 | -5.8 | 5.3 |
| Two-year-college graduate | 9.3 | 12.1 | -6.4 | 0.8 |
| Four-year-college graduate or other | 26.7 | 34.9 | -13.6 | -2.7 |

## Discussion

- Completed list assisted RDD design and randomized respondent selection
- Required stricter callbacks rules for the random selection of respondents
- Needed a study on bias due to the truncation of low-density stratum
- A study on differences in demographic characteristics between listed and unlisted numbers is useful
- Noncoverage problem due to at least $10 \%$ mobile only households should be solved
- The strategies for reducing sources of various errors must be developed
- Precision versus survey cost

## Acknowledgments

The authors wish to thank James M. Lepkowski, the chair of the Survey Methodology Program at the University of Michigan and Dale W. Kulp, the president of GENESYS Sampling Systems, for giving professional advice and encouragement to do this research project.

## Thank you!
